

“...the most revolutionary product for drafting a fireplace...”

No more smoke-filled rooms.

If you've been putting off buying a wood-burning stove, or wood insert because of concerns about backraft and smoke-filled rooms, worry no more. Introducing the first inline, fan-free draft inducer specifically designed for residential use on wood stoves (model DCWS-610) and inserts (model DCWI-610). This VESTA Award winning product preheats the flue to hundreds of degrees in just minutes. It's completely silent because there's no fan, or other moving parts. There's less creosote build up in the flue; and, most importantly, no carbon monoxide laced smoke pouring into the room.

Many wood inserts have problems with draw since they're set into a cold fireplace that's separated from the house by a panel, trapping cold air in the fireplace cavity. New inserts with secondary combustion struggle to get enough heat up the flue to create draw. The DCWI is compact enough to fit almost all applications and will solve these problems. It's built with high grade 304 stainless steel for safety and durability and comes with a built-in thermostat control that will shut the heater off once the fire is going and will turn back on when the fire dies down.

And the best part? We're so certain the DRAW COLLAR will operate exactly as advertised, we guarantee it. Completely.

 500 watts (3.8 amps)

Look what people are saying about the DRAW COLLAR...

"...the most revolutionary product for drafting a fireplace ... I had spent over \$900.00 on various products (ie. chimney liner extension, fan draft inducer, VacuStack) to no avail and thought that I was simply destined to live with smoke filled rooms until I got the Draw Collar."

"...We were ready to remove our wood-burning stove from our basement, the downdrafts were so strong and frequent. I found the Draw Collar online and ... my only regret is that I didn't get one sooner. It works great, and I've never had one problem—not ONE—since installing it."

"We had a new stove installed in the basement but just couldn't seem to get it started without smoking up the room. ...we decided that the Draw Collar would be the solution and it has worked very well. We're having to repaint the entire basement due to the original smoke damage but now we're confident that our smoky starts are history."

"I can walk away with minimal fire starting technique and it will light. I can turn the stove down low and it will hold a good clean burn with no worries about backpuffing or smoldering. I can also engage the catalytic at a lower heat range and air setting and walk away without having the fire snuff out or the catalytic get outside it's required heat range for it to function correctly. I also achieved a longer burn time with less wood because of the lower draft setting without compromising burn quality. It looks nice and I love using it."

"I've thrown away the hairdryer I would use to preheat my chimney tube every time I had to start a fire. I can now start fires in minutes any time, day or night, and my house no longer smells like a campfire."

"I used to have two issues with our fireplace. One with getting draw when starting a fire, causing smoke to enter the room instead of going up the chimney. The second issue was when the fire was dying down (usually when I had just gotten into my deepest sleep) and the smoldering fire not being hot enough to continue draw up the chimney - causing carbon monoxide and smoke to fill the house. Since I have installed the draw collar, I haven't had a single instance of either of these issues. The peak level of the carbon monoxide sensor still reads 'zero.' The peace of mind and improved function of the fireplace make every dollar spent on the Draw Collar worth it. I wish I had found it years ago."

"We have a cabin located at 9,000 feet ... my chimney is a little over 30 feet high and ... it was often difficult to get a draft flowing through that long column of cold air. We would frequently get smoke into the cabin and sometimes had a difficult time getting a good fire started. Since installing the Draw Collar those problems have been eliminated. Now when I arrive at the cabin, we turn on the Draw Collar first thing. By the time I get the truck unloaded and clean the ashes out of the stove, it is ready for a fire. NEVER ANY SMOKE IN THE CABIN AND ALWAYS A ONE MATCH FIRE."

"The installers told me that mine is an extreme case ... Previously, the installers had been out 3 different times (increasing flue diameter, re-insulating chimney surround, etc.), in attempts to alleviate the downdraft issue. Finally, the owner came out, evaluated the situation and said that a wood burning insert would not work ... and offered to replace it with a pellet insert (which we were not interested in). So when I purchased the Draw Collar, I was basically asking it to perform mission impossible. After 24 hours of testing, all I can say is: mission accomplished. No more smoke, no more blown-out fires, the flue draws like a champ. I was relieved, the installers were amazed, and (most importantly) my wife is finally happy with the insert."

"To light my fire I simply flip the switch to turn on the Draw Collar, wait about 15 mins, then light away, the fire immediately draws like it has been burning all night. Then I simply flip the switch off and we are good to go. No more hour-long fire lighting ordeals or smoke outs for me! This is a great product that exceeded my already high expectations!"

"The Draw Collar is one product that lives up to its claims."

"...no more smoke filled rooms, no smoke filled clothes, in fact, since installing the Draw Collar, it has even eliminated the smell of creosote from the chimney in our home. My wife is thrilled, and I'm still amazed at the simplicity and ease that the Draw Collar provides for any wood, gas or pellet stove application. Why didn't somebody think of this before?"

"We tried everything from a heat gun to blowing hot air up the stove pipe prior to starting the stove, to a new chimney cap which was suppose to eliminate down drafts, to lighting balls of newspaper to create a chimney effect, and the list goes on. None of these options to fixed our problem. We were tired of having soot and smoke in our home and all the smoke alarms going off in our house each time we wanted to light a fire. I ... finally came across the Draw Collar. It really does do the trick just as it is advertised to."

"I power on the Draw Collar and within about 20 minutes it is time to start a fire with no down draft. Stubborn as I am, I tried starting a fire without the Draw Collar plugged in. Guess what happened? Got Smoke. So for your future customers out there I have a question. Got Smoke? Get a Draw Collar."

"I wasn't sure what to expect, but I had heard this thing works like a miracle. Since its installation we have experienced most of the radical weather patterns for our area. We have had temperature inversion, high winter winds, blizzard conditions, and warm day/cold night weather that requires daily restarting of our fire. I've been amazed at what this thing does ... It just seems to alleviate the issues that accompany the use of indoor wood burning ... You really need to look into this Draw Collar. It's sort of a miracle cure for the wood burning heat system."
